

LUMEN — Telegram Onboarding & Support Bots

Specification — September 2026

1. Overview

Two separate Telegram bots operate alongside the LUMEN customer group: an onboarding bot that qualifies a customer's device, sells the right plan, and hands off credentials, and a support bot that triages issues. Both run as lightweight webhook services and share an admin group/topic where Oran completes the manual steps (credential creation, payment confirmation review).

2. Bot & Group Setup

- Create the Telegram group for LUMEN customers.
- Create two bots via @BotFather: **LumenOnboardBot** and **LumenSupportBot**. Save both tokens.
- Onboarding and support run as DMs (not posted in the public group) to keep customer details private; the group links out to the onboarding bot.
- Create a private admin group/topic — both bots post here whenever Oran needs to act manually (new credential needed, unresolved support ticket).
- Both bots can run in one Node process on a single webhook server once hosting is set up (two Telegram bot instances, two tokens) — no need for separate deployments.

3. Subscription Tiers

Flat price per device count — device type doesn't matter (a Firestick, a phone, and a laptop all just count as "1 device" each).

Tier	Devices	Notes
Plan 1	1 device	Any mix of stick / phone / PC
Plan 2	2 devices	Any mix of stick / phone / PC
Plan 3	3 devices	Any mix of stick / phone / PC

Known gap: the Xstream panel does not currently enforce max concurrent streams per plan tier — it's a promise, not a technical limit. Worth setting a *max_connections* value per account later if credential sharing becomes a real cost. Not a v1 blocker.

4. Recommended Player App per Device

Device	App	Free?	Notes
Firestick / Android TV stick	IPTV Smarters Pro	Yes	Sideloaded via Downloader app
Android phone	IPTV Smarters Pro	Yes	Same app as stick — one UI to support
iOS phone	GSE Smart IPTV	Yes	Smarters Pro isn't reliably on the App Store; GSE has ads on fr

Windows / Mac PC	IPTV Smarters Pro	Yes	Official desktop build
Smart TV (native)	— none —	—	Most Smart TVs can't sideload; route to "get a Firestick" instead

5. Onboarding Bot — Flow

Step 1 — Welcome

Any inbound message (e.g. "hello") triggers: "Hello! Welcome to LUMEN. Let's get your onboarding started." followed by: "Do you have a streaming device currently?" (Yes / No buttons).

Step 2 — Device check

- **Yes** → free-text prompt: "What's the make and model?" Checked against a maintained device lookup DB (not a fixed button list, since models vary too widely).
- Device found, sideload-capable + 4K → continue to plan selection.
- Device found, sideload-capable but not 4K → continue to plan, but flag HD/FHD only, not 4K.
- Device found, not sideload-capable (e.g. native Smart TV) → recommend a Firestick, loop back to device question.
- Device **not found** in the DB → don't guess. Reply that it's being checked, flag it to the admin group for manual review and addition to the DB.
- **No device** → recommend a sideload-capable Firestick generically (not a hard push toward Oran's own preconfigured stick specifically — just the most compatible option).

Step 3 — ISP flag (informational only)

Ask which ISP the customer is on. Cross-check against a maintained list of known-problem ISPs (e.g. AT&T has intermittently blocked Cloudflare-fronted traffic). If matched, show a heads-up note but do not block onboarding — a workaround is a later fix, not a v1 gate.

Step 4 — Pause state for device purchase

When a Firestick is recommended, the flow doesn't wait on a reply. It ends with a persistent button: "I've got my device — continue." Session state is stored as *awaiting_device_purchase*, keyed to the user's Telegram ID, with a timestamp.

- One re-engagement nudge after 2–3 days if the button hasn't been tapped.
- Tapping the button at any point (same day or weeks later) resumes exactly at plan selection — no re-answering the device question, no /start needed.
- After ~2 weeks of no response, mark the session *abandoned* in the store (for admin visibility only) — a later message still resumes cleanly rather than restarting.

Step 5 — Sideload walkthrough (inline, for stick users)

- Settings → My Fire TV → Developer Options → enable "Apps from Unknown Sources".
- Install the Downloader app from the Firestick app store.
- Enter the Smarters Pro APK code/URL in Downloader.
- Install → open Smarters Pro → enter Xstream Codes server URL, username, password (sent after payment).

Step 6 — Plan selection

"How many screens?" → 1 device / 2 devices / 3 devices (flat pricing, device type irrelevant) → bot sends the static PayLio payment link for that tier.

Step 7 — Payment confirmation (manual)

Customer confirms they've paid via PayLio (Apple Pay/card in, USDC out to Oran's Base wallet, no KYC). Bot posts a notification to the private admin group/topic: customer handle, plan tier, device, ISP flag if any.

Step 8 — Credential handoff

- Oran manually creates the Xstream Codes account on the panel (API-based automation is a later phase).
- Oran replies directly to the bot's notification message in the admin group with the new username/password.
- Bot detects the reply-to-message and forwards the credentials to that customer automatically.
- For stick users, the inline Downloader/Smarters Pro walkthrough (Step 5) is sent alongside the credentials.

6. Support Bot — Flow

- **Any message / !start** → category menu: Server down / Buffering / Login issue / Billing / Other.
- Each category → 1–2 quick diagnostic questions (e.g. "Server down" → "Which device?" → "Try restarting the app — still broken?").
- Unresolved after diagnostics → logs a ticket to the admin group/topic (device, plan, timestamp attached so Oran isn't re-asking basics).
- For confirmed outages: a simple status flag Oran can flip (e.g. a checked value or pinned message) lets the bot auto-reply "known issue, we're on it" instead of opening duplicate tickets.

7. Payments

Processor: **PayLio** — accepts Apple Pay / card, no KYC, settles as USDC to Oran's Base network wallet.

Payment links are **static, one per plan tier** (3 fixed links total) rather than generated per order — this needs no API integration and fits PayLio's no-account link model. Per-order link generation via PayLio's API is a possible future upgrade once volume justifies the integration work.

8. Build Notes

- Framework: Node + Telegraf — good inline-keyboard support, simple webhook setup.
- Session/order state: start with SQLite (or in-memory during local dev), keyed by Telegram user ID.
- Device compatibility DB: flat JSON/JS object — device → {compatible, 4k_supported, platform, app_to_install, setup_steps_ref}.
- ISP problem-list: same pattern — a small maintained list, not a service.
- Local development: run both bots with long polling, no server required. Switch to webhooks only once deploying to a live host (free tier on Railway/Render/Fly.io works fine at this scale; a low-cost VPS is the fallback once LUMEN's own infra needs one anyway).

9. Deferred — Not v1

- Concurrent-stream enforcement on the Xstream panel.

- Automated credential creation via panel API (replacing the manual admin handoff).
- AT&T / Cloudflare ISP block workaround.
- Automated payment confirmation (Stripe-style webhook equivalent for PayLio, if/when available).
